Desert Tank Battle

The last major stronghold of Robot forces outside the U.R.S. is hidden in ancient castle ruins in the middle of the desert. A fleet of desert hovertanks has been sent to destroy it and you are the commander. Your tank controls the five remaining missiles.

You must assess carefully the direction and elevation before you launch each one. Your computer will ask you for a direction angle between —90° (extreme left) and +90° (extreme right) and an elevation angle between 0° (along the ground) and 90° (straight up in the air). The elevation determines the distance the missile will travel.

Is your aim good enough to destroy the robot stronghold?

Making the game faster or slower You may find that the computer works too quickly

or too slowly for you in this game. You can adjust this by changing the last number in line 110, A lower number will make the game faster.

Puzzle corner

Can you change the program so that you get two kinds of target – either O (one of the Baron's Ordinary soldiers) which is worth 1 point, or 3 (one of his Special branch) which is worth 5 points?

How the program works

Sets your score to zero for start of game.

Beginning of loop which gives you 10 goes.

Sets up an empty string, RS.

Selects a number between 1 and 9 and puts it in T.

Loops round 9 times, adding a character to the string, RS, each time. The character is O for the position corresponding to the number in T and a dot for all the others.

Prints the string.

Loops round a number of times to see if you are pressing a key. (End of loop at line 140)

Checks if you are pressing the right key. Jumps to 170 if so.

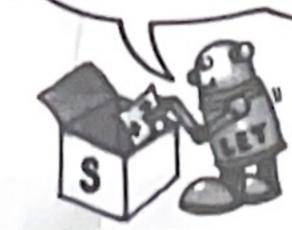

Prints if you pressed the wrong key or didn't press in time, then jumps to 190.

Increases your score by 1.

Sends computer back to line 30 for another go.

Prints your score when 10 goes are up.

> Notice how the scoring works in this program (lines 20 and 180). You could try adding this to other programs.

Robot Invaders

You must act quickly. Robot invaders of all kinds are approaching. You have plenty of weapons, but for each type of Robot you must select exactly the right one for it to have any effect.

Code symbols for each Robot will flash up on your screen. Quickly press the key with that symbol on it -beware, some need the shift key too - and see how many Robot invaders you can destroy.

Can you adjust the program so that you get 100 points for each of these and only 10 points for any of the others?

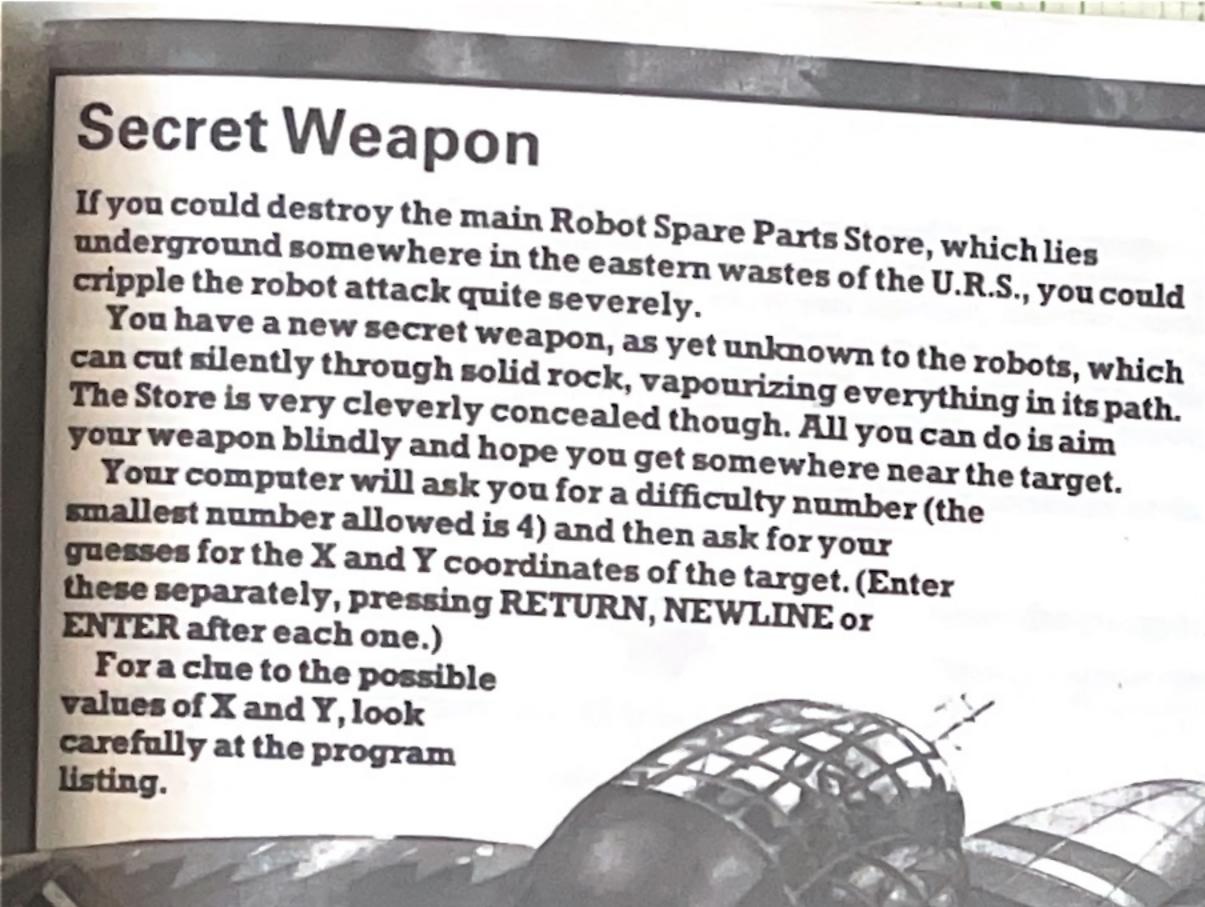

-Clears screen

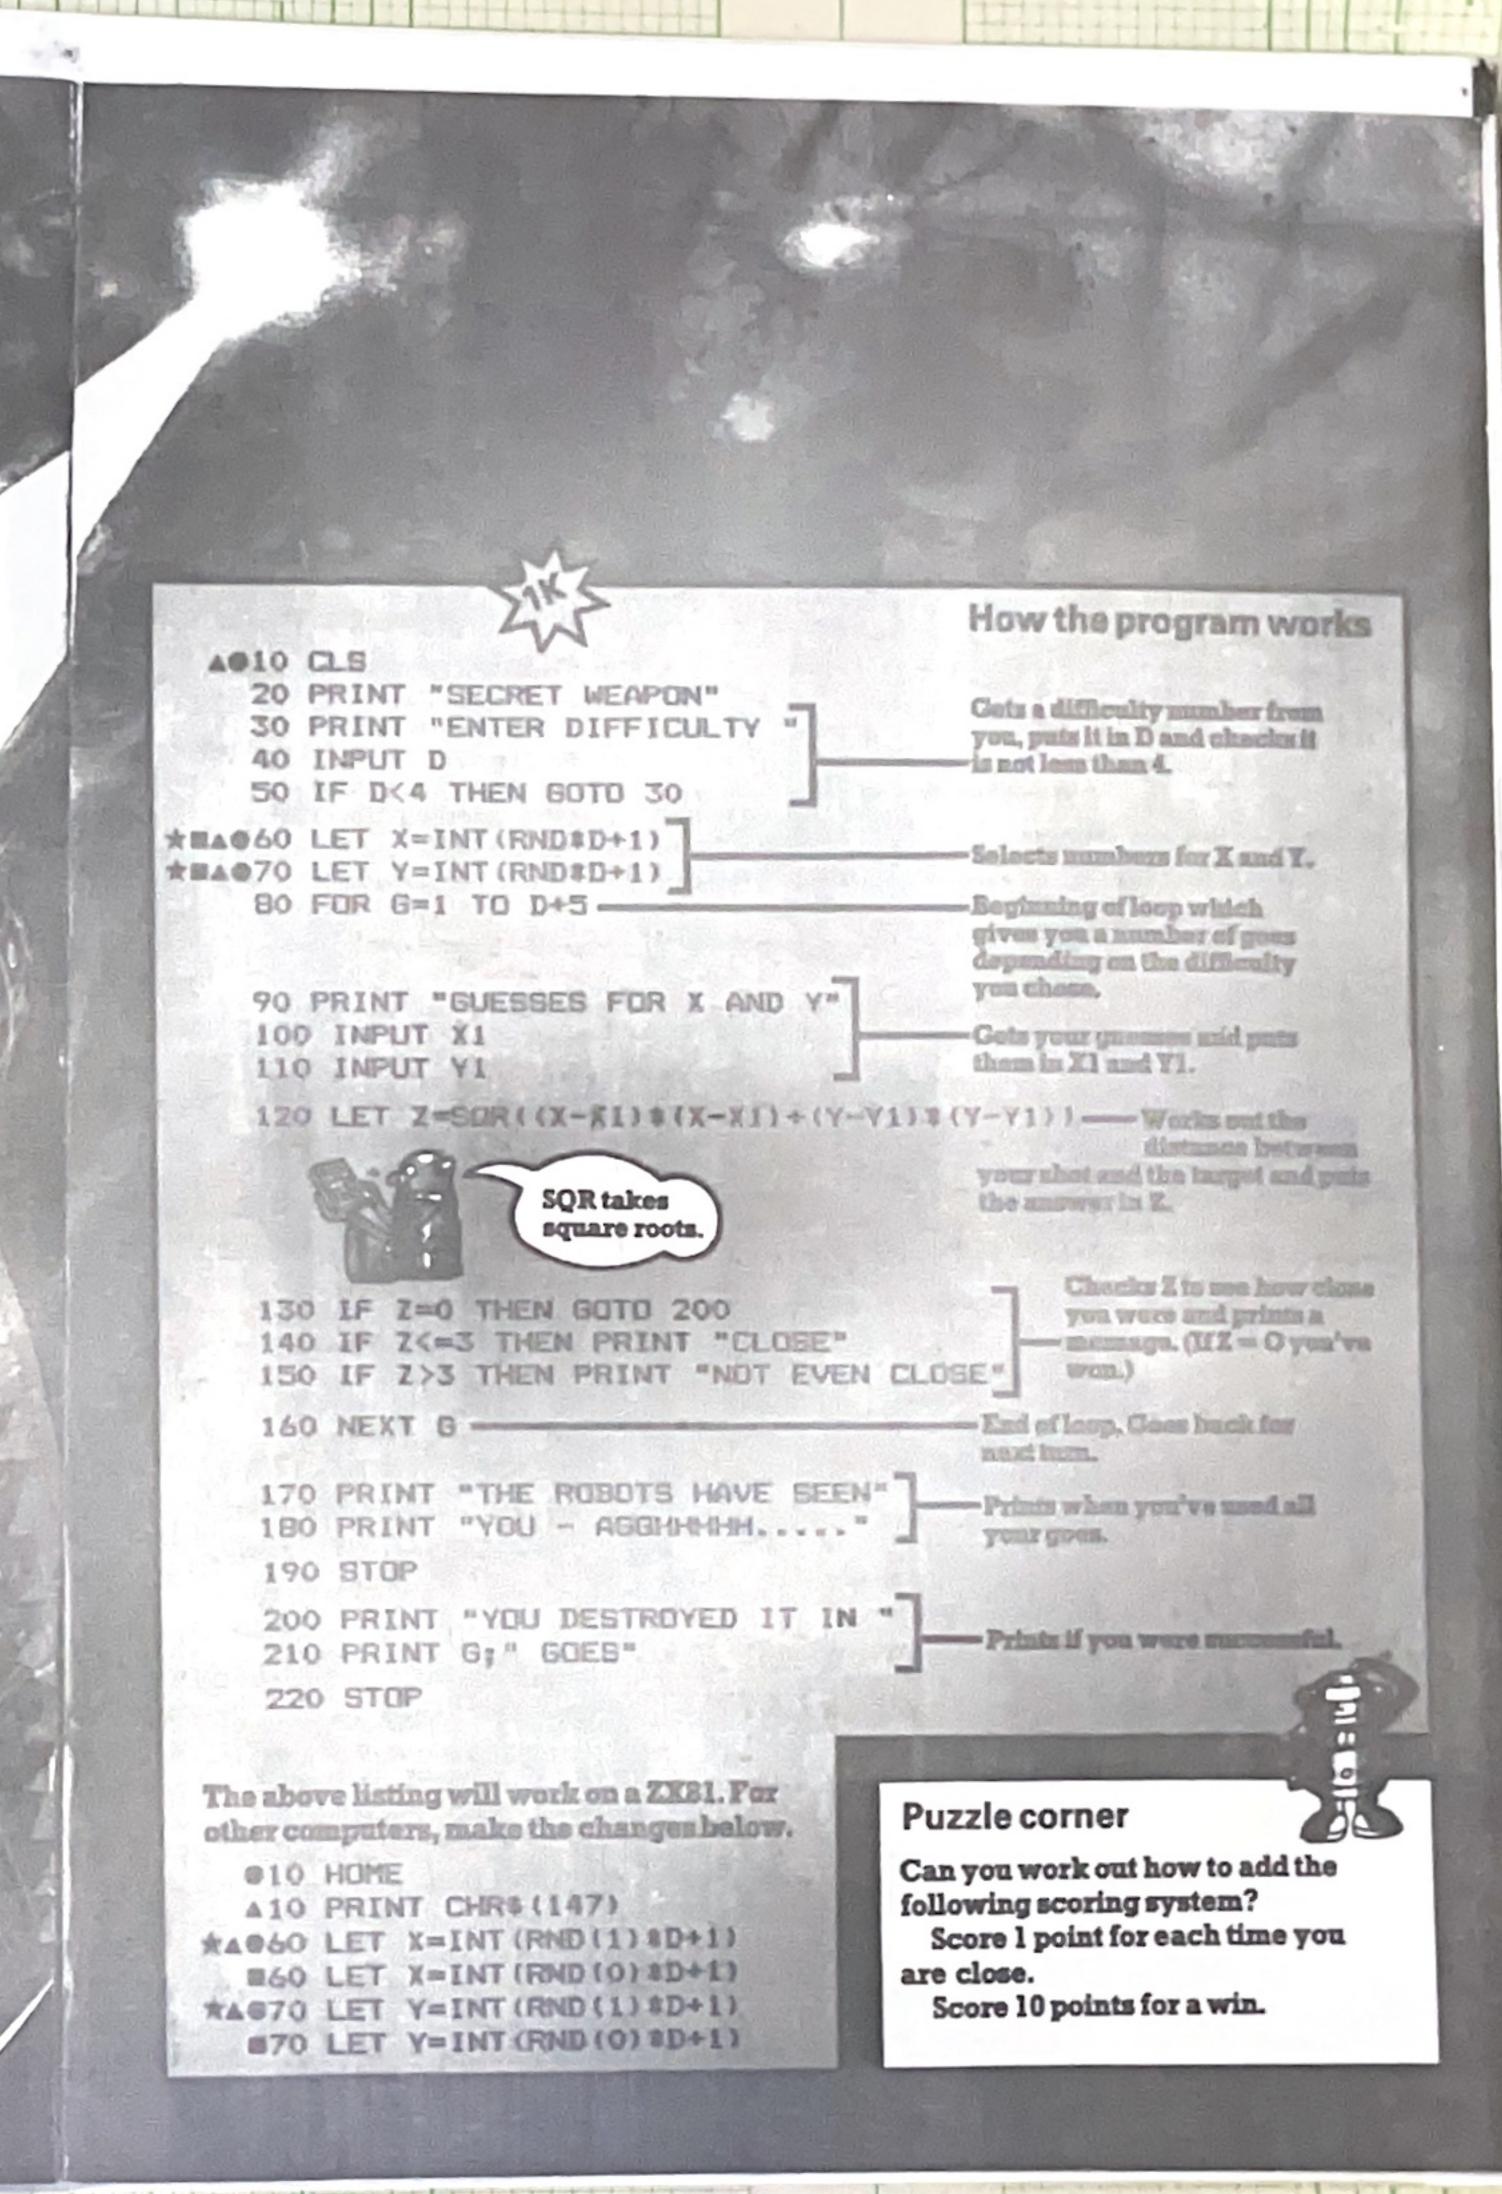

(which was chosen in line 70).

Moves cursor A spaces across the screen and prints

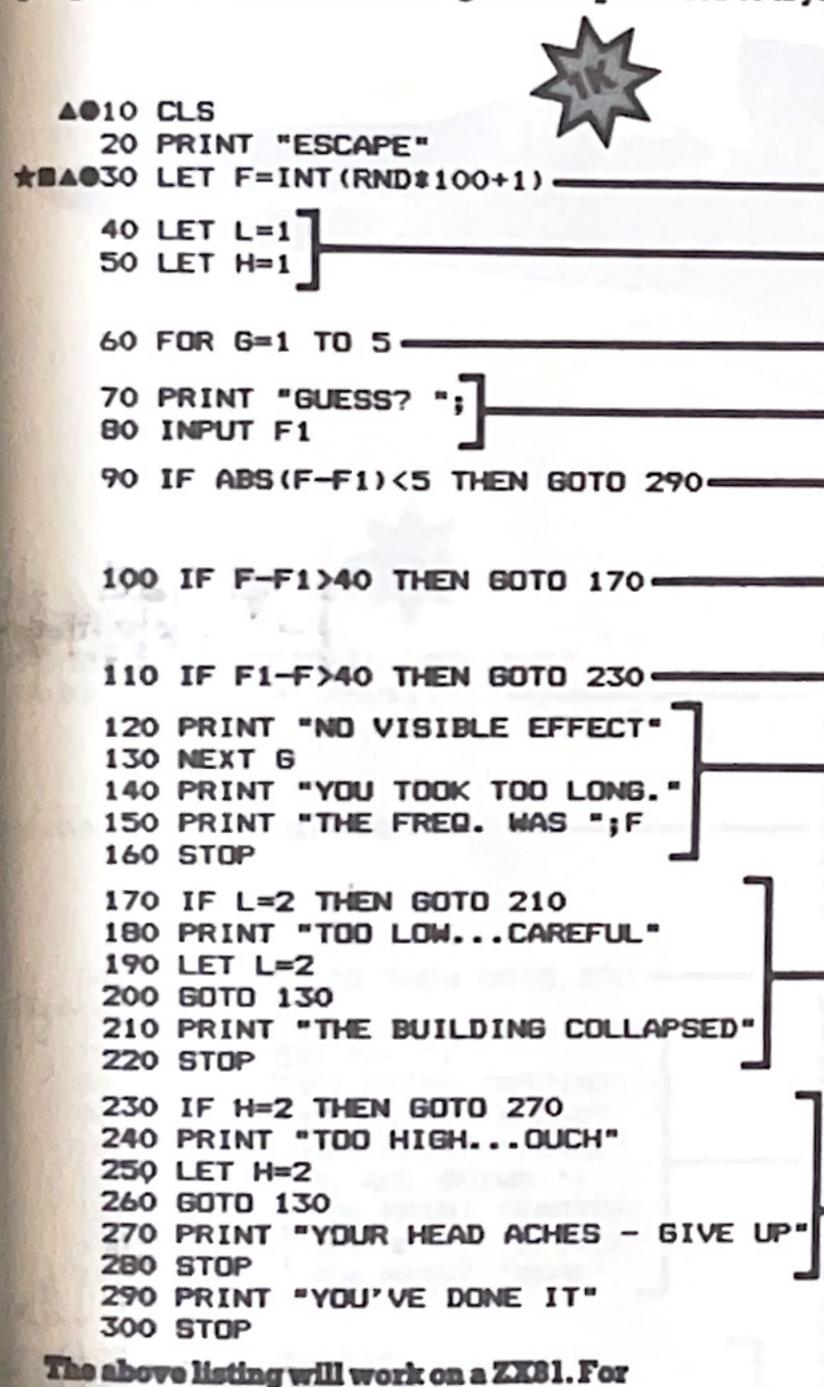

The Robots have caught you, taken your weapons and locked you up. Suddenly you remember you still have your sonar wristwatch, which can be tuned to produce sounds of any frequency. If you can only find the resonant frequency of your Robot guards, they should vibrate so much they fall apart.

You must be careful not to use frequencies that are too low or the building will vibrate and collapse on top of you. If you go too high, you will get such a terrible headache you will have to give up.

Can you escape the horrors of the Robot prison? (Look carefully at the

program for a clue to the range of frequencies to try.)

other computers, make the changes below.

#A030 LET F=INT(RND(1) #100+1)

#30 LET F=INT(RND(0) #100+1)

A10 PRINT CHR\$ (147)

010 HOME

How the program works

Chooses a number between 1 and 100 for frequency of robots and puts it in F.

Puts I in L and H. These are used if you go too low or too high - see lines 170-190 and

Beginning of loop which allows you to have 5 turns.

Gets a guess from you and puts it in F1.

-Checks if your guess is within 5 of F. If it is, jumps to 290 to print YOU'VE DONE IT.

Jumps to 170 if your guess is so low it is less than F by more than 40.

Jumps to 230 if your guess is so high it is more than F by more than 40

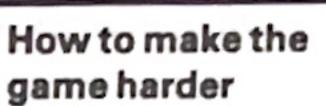

Prints if your guess was within 40 of F and goes back for next turn. If all turns have been used, it prints the answer.

Checks the value of L. The first time this part of the program is reached, L is 1. So the computer moves down the program to print a warning, change L to 2 and go back for another turn. Next time line 170 comes into operation the program jumps straight to 210 to tell you you've lost.

These lines check H in the same way to give you a warning first time you go too high and tell you you've lost the second time.

Puzzle corner

The three Robot guards each have their own resonant frequency. You can't escape until you have found all three. How could you change the program to do this?

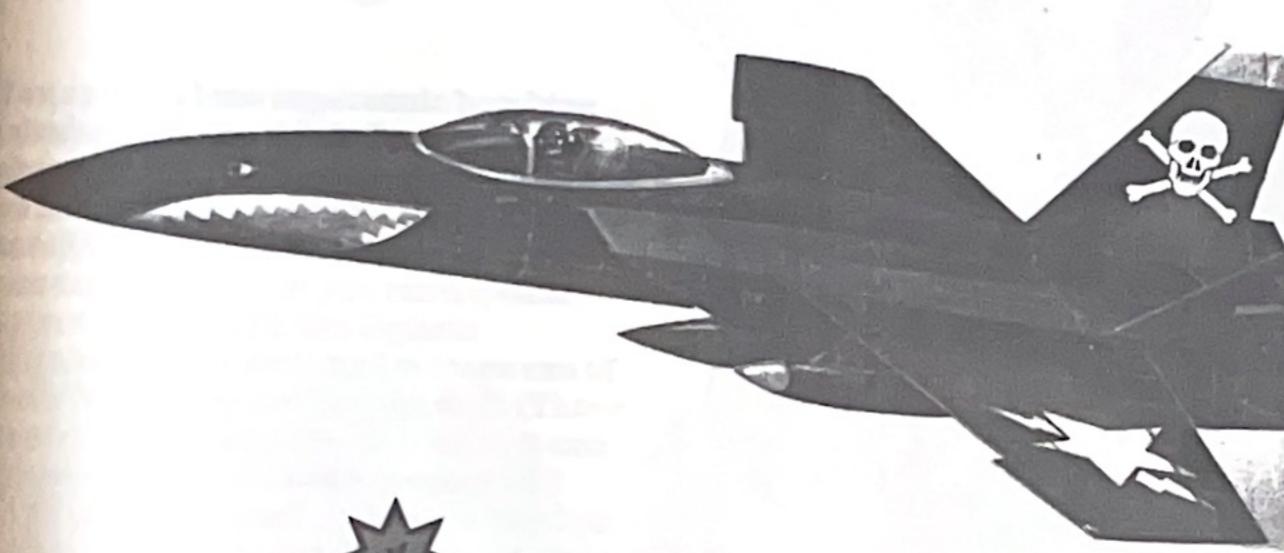

Change the 5 in line 90 to a lower number. This means you have to get closer to F to win. You can also increase the possible range of F by changing 100 in line 30 to a higher number.

It's you against the Sky Pirate. He moves ahead, you accelerate - He drops behind, you slow down. You must try to get level with him and then you can fire, hoping that he won't be able to fire and hit you first.

Use the letter keys A to accelerate, D to decelerate and F to fire. Your computer will tell you your speed and position relative to the pirate. You will need to be ready to press the appropriate keys as soon as you press RUN. Keep pressing A and D until you get level and then fire.

A010 CLS

20 PRINT "PIRATE DOGFIGHT"

How to make the game easier

*A 040 LET S=-INT (RND(1)#3+1)

040 LET S=-INT(RND(0)#3+1)

You may find this game quite difficult. To make it slightly easier, add these two lines. You will then be able to see the relative positions of the two planes printed on the screen.

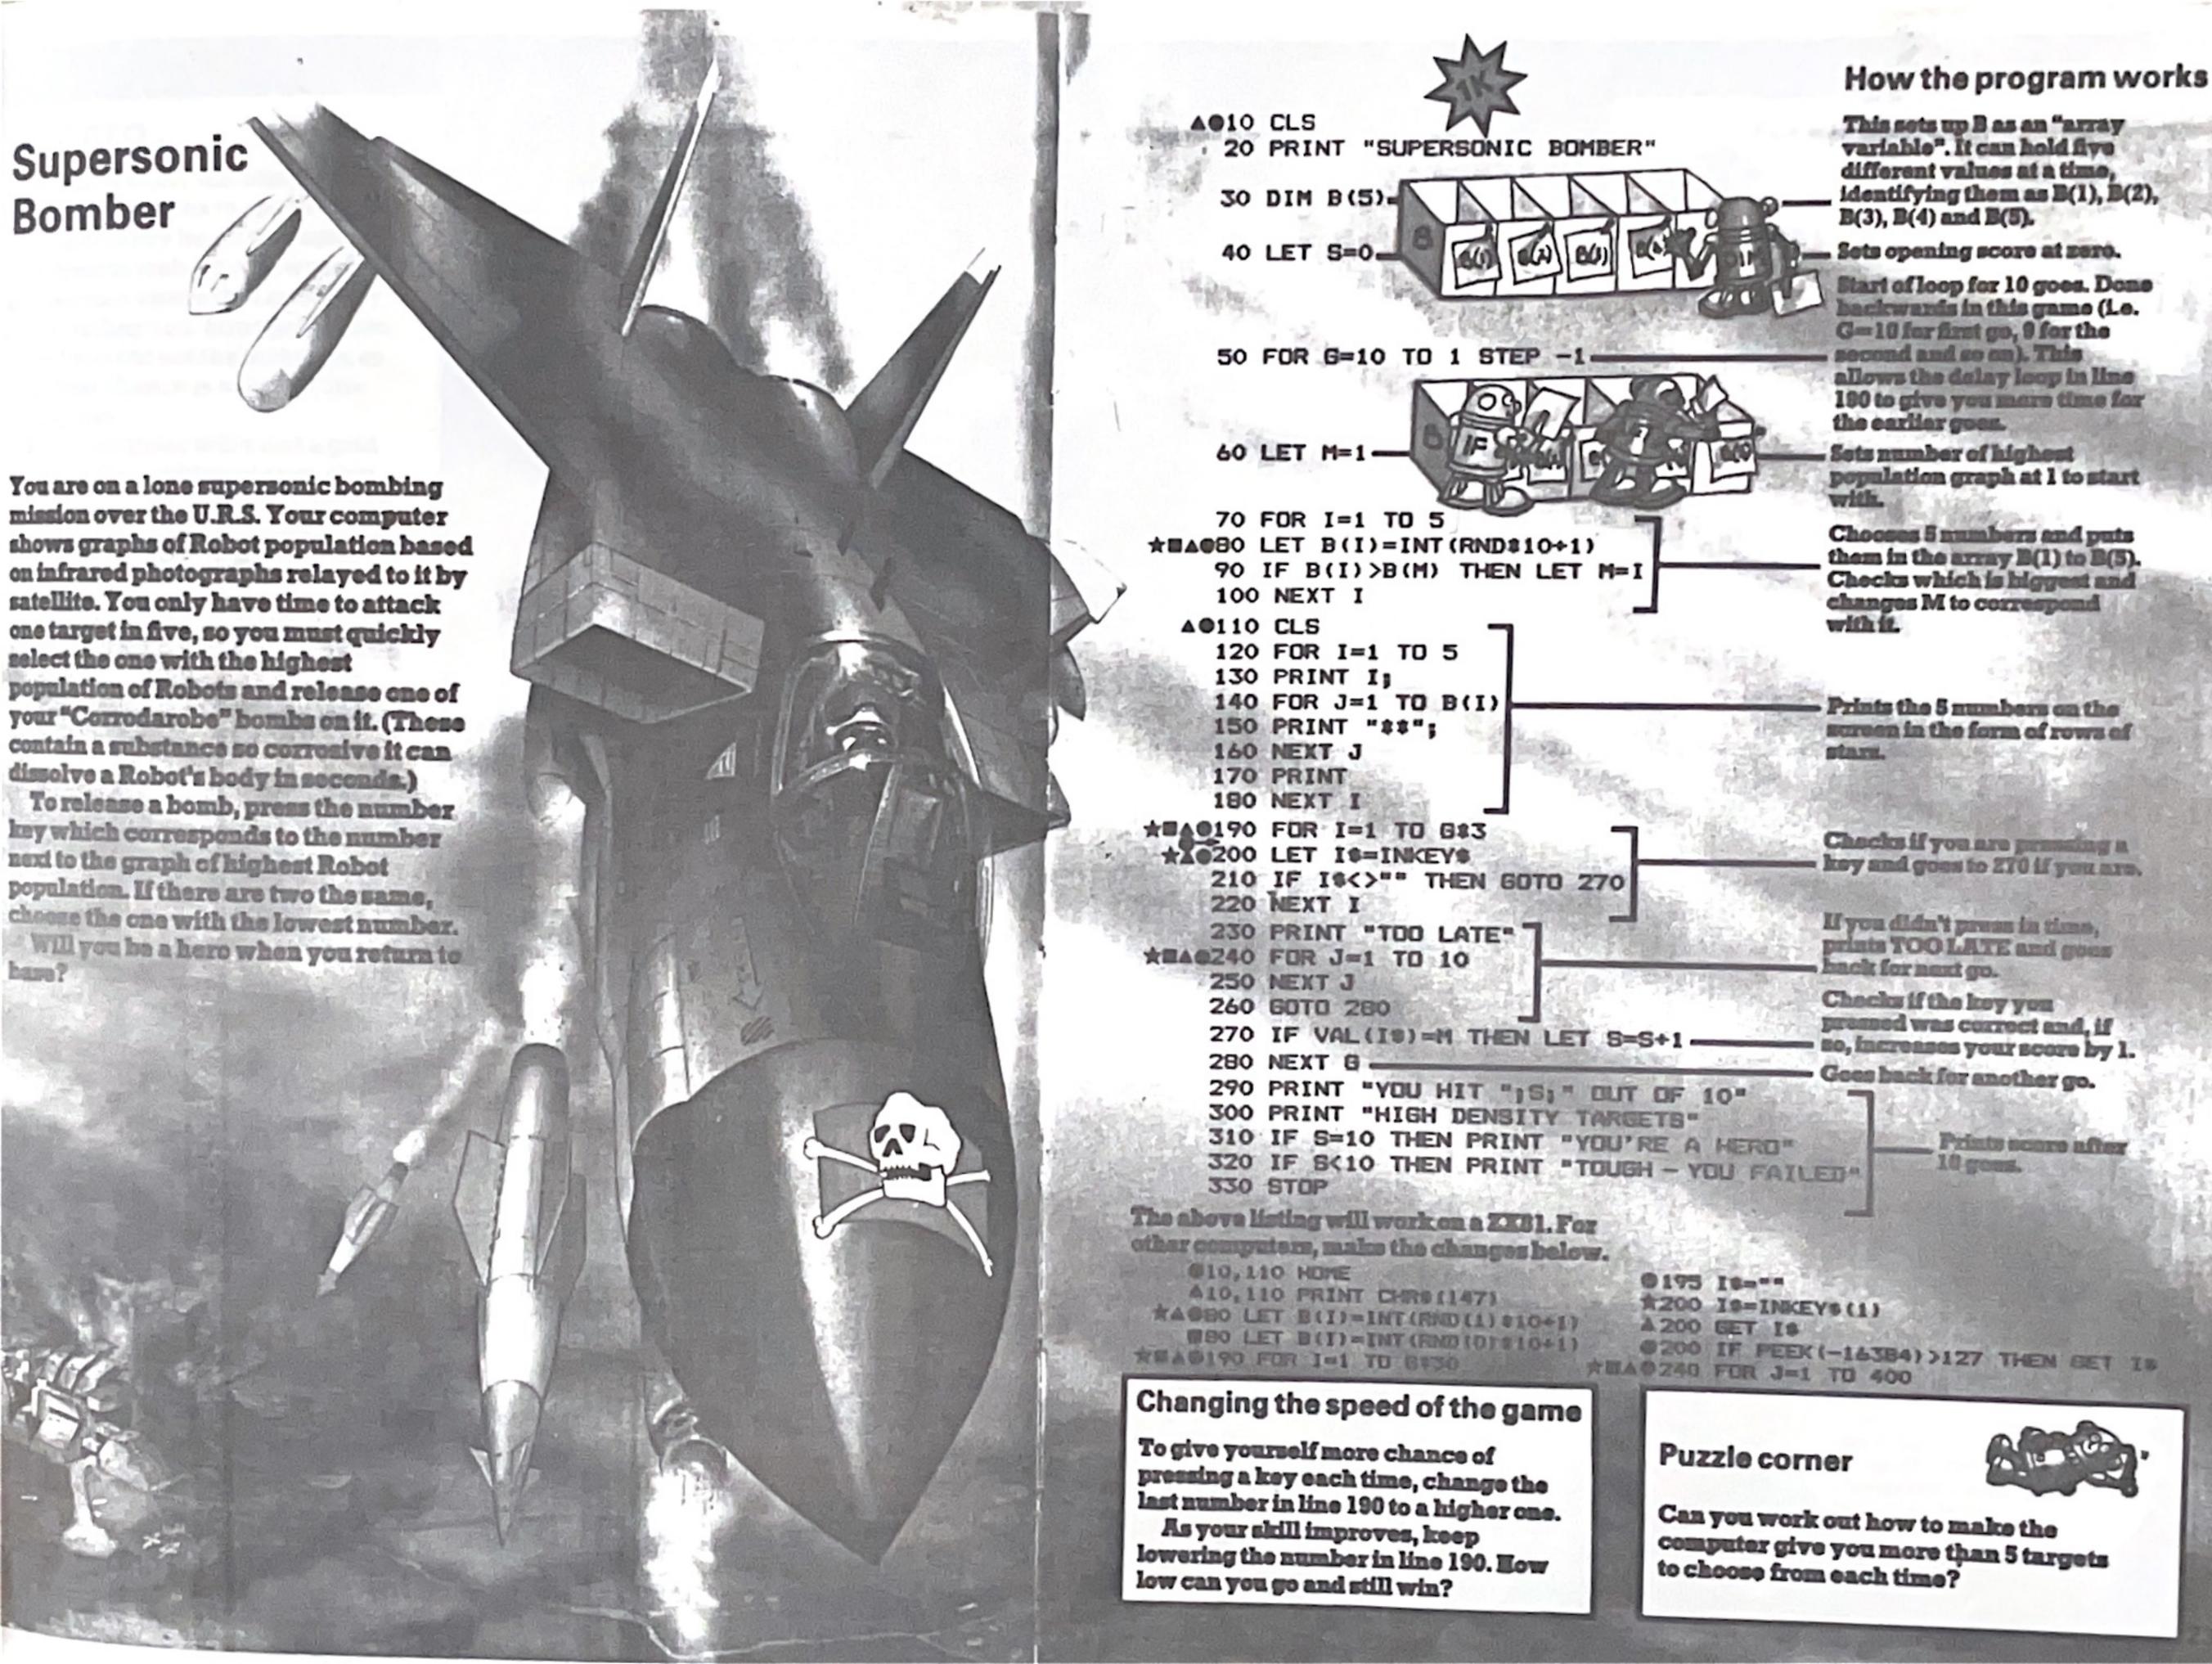

195 IF ABS(S)>10 THEN GOTO 200 196 PRINT TAB(w/2); "HIM" 197 PRINT TAB(S+w/2); "YOU"

Replace w with the width of your screen.

The random test in line 290 is loaded in your favour. How could you change it so your chances of winning are equal?

you've no weapons to speak of. As you limp slowly home through reacherous iceberg-strewn waters, you become aware that an enemy thip is tailing you. Strangely it can detect you but not the icebergs, so your best chance is to lure it into hitting one.

Your computer will print a grid showing the position of your ship
(Y), the enemy (Z) and the icebergs
(*). You can move one space North,
South, East or West each go. The
enemy moves towards you by the
most direct route (it can move
diagonally too). If you move into any
of the 8 positions surrounding the
enemy, you will be captured, and if
you hit an iceberg you will sink.

Can you escape?

PRINT

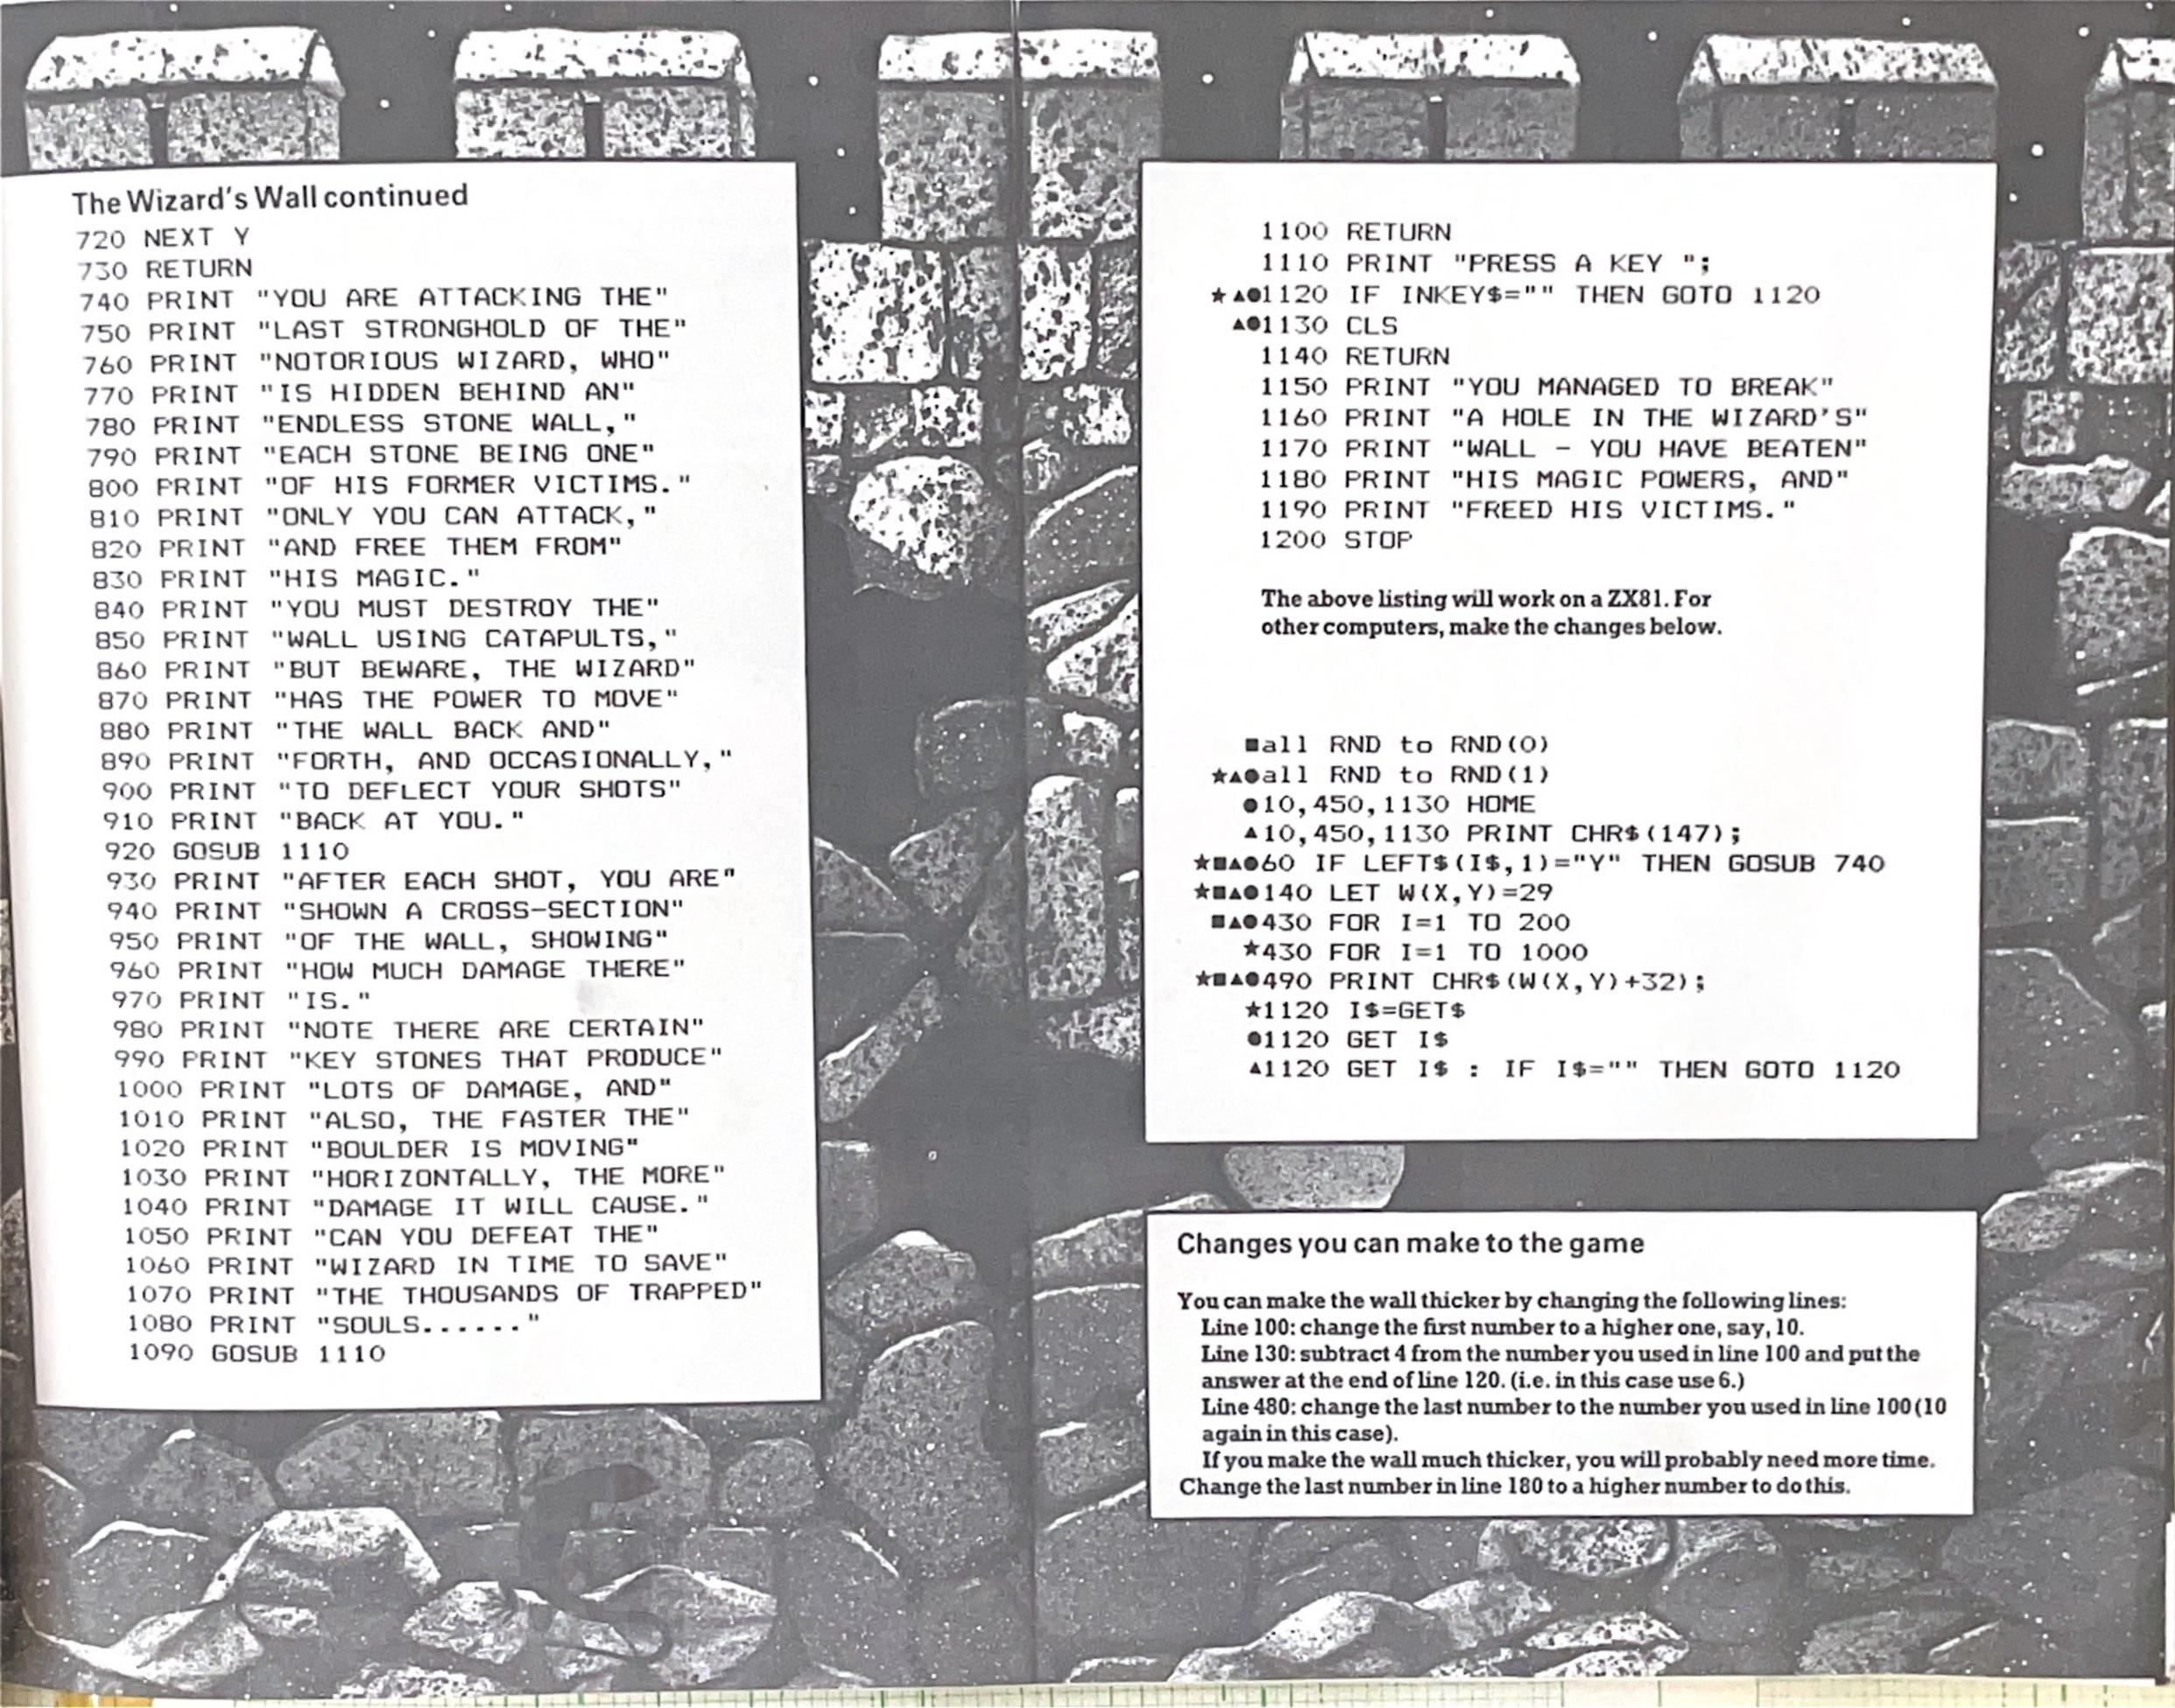

The Wizard's Wall

The wall the Wizard built to surround his secret stronghold is no ordinary wall. The stones in it are people, petrified by the Wizard's angry stare, and, what's more, it can move. If you can break a hole through it with your trusty catapults which fling gigantic boulders, you will destroy the Wizard's magic powers and turn the stones back into people again. There are problems though – the Wizard is working on a spell which stops missiles in mid-air and sends them back where they came from. Sometimes he can make it work...

If you don't succeed, you will become just another stone in the Wizard's Wall!!!!

Missile!

This game is different from the others in this book because it uses graphics. As the computers vary so much in the way their graphics work, there is a separate ; rogram for each one. Read the instructions on this page for how to play the game and then look through the pages that follow for the version for your computer.

How to play Missile!

You have three missile bases, each capable of launching one missile. When you see a plane approaching, you must judge its height and speed and fire your missiles at it one by one.

Your missiles are launched by pressing any key. The first time you press launches the left-hand one, second time the middle one and third time the right-hand one.

See how many enemy planes you can shoot down.

Adding to the programs

Here are some ideas for additions you can make to the programs in this book or to your own programs. In most cases you won't be able to add these to a ZX81 with only 1K as the games themselves fill almost all its memory space, but you should find there is plenty of room on the other computers.

Remember you will either have to restrict your additions to the spare line numbers in a program or renumber the program. If you decide to renumber, take care you change all the GOTO and GOSUB lines too.

Getting the computer to tell you how to play

You can add a section to any program to make the computer print instructions telling you what to do. The easiest way to do

this is to add some lines, such as those below, at the beginning of the program and then put a sub-routine at the end.

10 PRINT "TITLE OF GAME" 11 PRINT "DO YOU WANT TO" 12 PRINT "KNOW HOW TO PLAY?" 15 INPUT IS X17 IF I\$(1)="Y" THEN GOSUB 1000 017 IF LEFT\$ (1\$,1) = "Y" THEN GOSUB 1000

main program goes here 1000 PRINT "WHAT YOU HAVE TO"

1010 PRINT "DO IS....." 1999 RETURN

You can add as many print statements as you like for the instructions, just remember to put a number and the word PRINT at the beginning of each * BAO7 IF LEFT* (J\$, 1) <> "Y" THEN GOTO 5 one. Restrict the length of the part inside the quotation marks to the number of characters your computer can print on one line. Don't forget to put a RETURN line at the end or the program won't work.

Making the computer stop and wait for you

If your instructions are very long, you may want to insert this sub-routine which stops the program running at a particular point until you press a key. This way you can stop the instructions scrolling off the top of the screen before you have read them. Put a GOSUB line at the place you want the program to stop and then put this subroutine at the end.

1000 PRINT "PRESS A KEY TO CONTINUE "; ms zx1010 IF INKEYS="" THEN GOTO 1010 **★1010 IS=GETS** ●1010 GET IS A1010 GET IS : IF IS="" THEN GOTO 1010 1020 PRINT 1030 RETURN

Making the computer "talk" to you

You can make the computer ask you questions and react to your answers. For instance, here is an addition which will make the computer refuse to play with you unless your name begins with J.

I PRINT "WHAT IS YOUR NAME?" 2 INPUT IS 3 IF I\$(1)<>"J" THEN GOTO 1000 3 IF LEFT\$(I\$, 1)<>"J" THEN GOTO 1000 4 PRINT "OK-YOU CAN PLAY." 5 PRINT "ARE YOU READY?" 6 INPUT J\$

main program here

1000 PRINT "SURRY THIS GAME IS" 1010 PRINT "ONLY FOR PEOPLE" 1020 PRINT "WHOSE NAMES BEGIN" 1030 PRINT "WITH J"

Here is another one where the computer dares you to be brave enough to play.

10 PRINT "VERY SCAREY GAME" "TO TACKLE THE GREEN" "HAIRY MONSTER?" 14(1)="Y" THEN GOTO 20 LEFT\$ (1\$.1) = "Y" THEN GOTO 20 18 PRINT "COWARD" 19 STOP

You could combine this with the instruction sub-routine by taking lines 11 to 17 from the instructions section on this page and putting them at lines 20 to 26 of this program. You can then start the main program at line 30 and add the instruction sub-routine at the end.

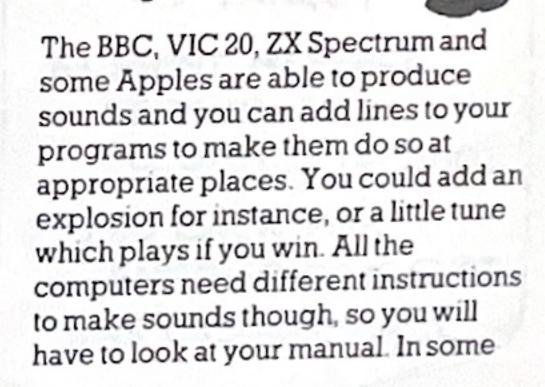

Would you like another go?

Instead of typing RUN each time you play a game, you can make the computer ask you if you'd like another go. Put these lines at the end of the program, just before the last STOP statement.

1000 PRINT "DO YOU WANT ANOTHER GO?" 1010 INPUT IS S ZX1020 IF I\$(1)="Y" THEN RUN ★■▲●1020 IF LEFT\$(I\$,1)="Y" THEN RUN 1030 PRINT "DK THEN - BYE" 1040 STOP

> Change line numbers according to your program.

Adding sound effects

cases you can add a single line to your program at the place you want the sound. In others, you need several lines and it is best to put these in as a sub-routine.

As an example, here is the sound of a shot for the BBC. You can experiment with where to put it in the program, but you must give it a line number to make it work:

SOUND 0, -15,5,10

At the back of the VIC manual you will find some useful sub-routines for sounds such as "laser beam", "explosion" and "red alert". Put a GOSUB line where you want the sound to appear, number the sub-routine and add a RETURN at the end of it.

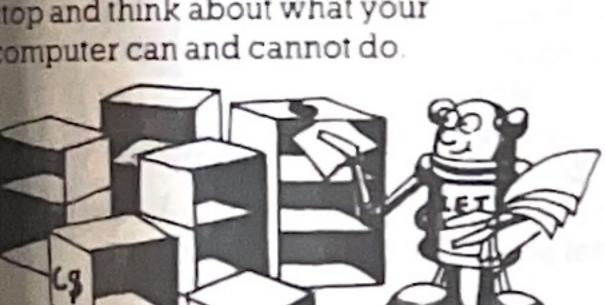

Special note for BBC and Spectrum users

If you have a BBC or a ZX Spectrum you may find that some of the games in this book run too fast for you. You will find a box next to these games containing instructions for changing the speed. Remember, to slow the game up you always need to use a higher number. Later models of the BBC may run up to twice as fast as the earlier models, and this could make the games appear impossible on the first run. Be prepared to make big changes to the speed number to correct this.

Writing your own programs

As you work through the games in the book, you will probably find yourself making more and more changes to them and eventually wanting to write new games of your own. On these two pages you will find some hints on how to set about doing this.

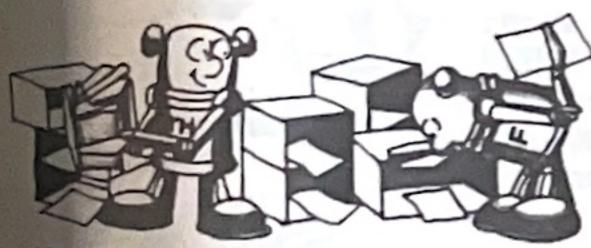

Before you start, it is a good idea to stop and think about what your computer can and cannot do.

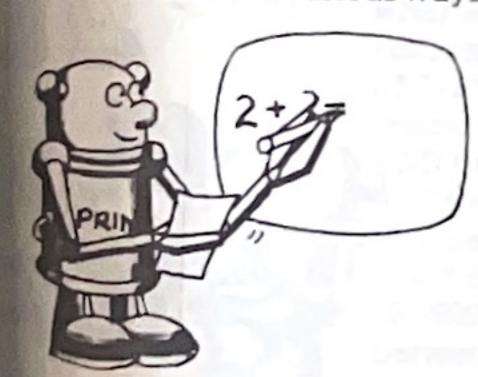

*It can store information

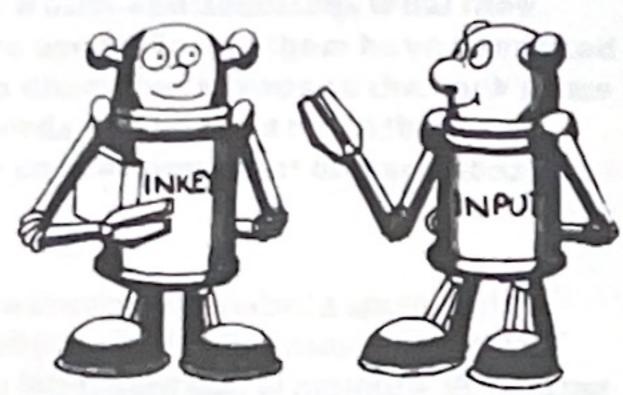

'It can do calculations

It can make decisions by comparing items of information in various ways.

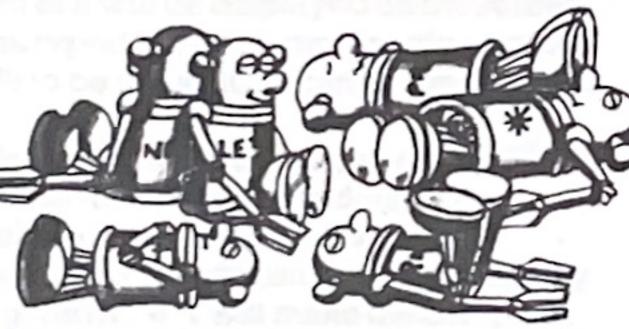

It can tell you the results of its calculations and decisions and also what is stored in its memory.

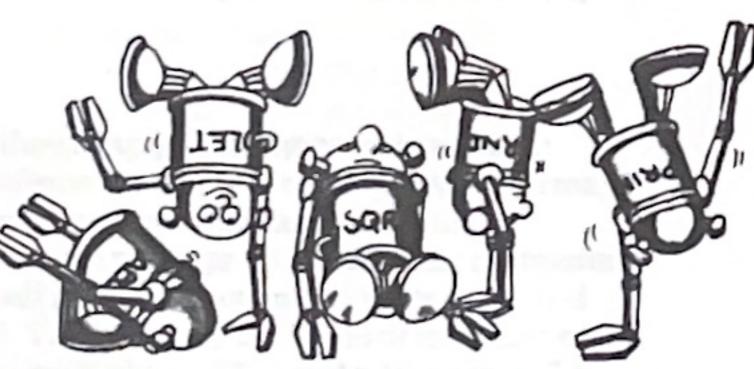

*It can ask you for information.

'It can select numbers at random by using RND.

*It cannot do anything unless you tell it

*Provided you use its language correctly, it can do only exactly what you tell it, even if it is silly.

Remember, when you are trying to work out a game, not to include anything which your computer won't be able to do.

Planning a game

Before you can tell the computer how to play your game, you must know exactly how to play it and what the rules are yourself. The computer will need a series of simple logical instructions, so work out your game in your head or on paper first and then break it down into simple steps.

Next write a plan (in English – don't try to use BASIC yet) of all the stages of the game in order.

Here is a plan for a simple shooting game, such as firing cannon balls at a pirate ship or shooting laser beams at an alien invader, to give you an idea.

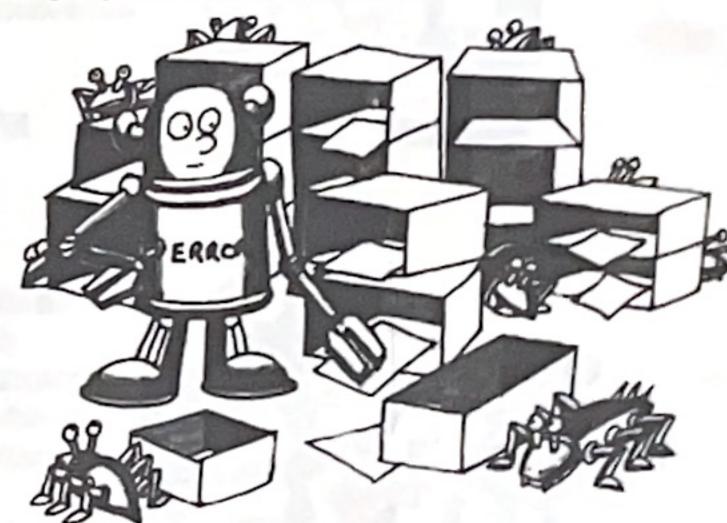

PLAN

- PRINT TITLE AND INSTRUCTIONS
- 2) CHOOSE A TARGET FOR THIS GAME
- 3) BEGIN A LOOP TO GIVE THE PLAYER N GOES
- 4) GET A SHOT FROM THE PLAYER
- 5) CHECK IF SHOT WAS ON TARGET
- 6) PRINT MESSAGE DEPENDING ON ACCURACY OF SHOT
- 7) 90 BACK FOR ANOTHER GO IF SHOT WAS UNSUCCESSFUL

Writing the program

The next stage is to convert your plan into BASIC. Each step in your plan may need several lines in BASIC. Don't forget to leave gaps when numbering your program lines so you can go back and add extra ones if you need to.

Do a first draft of the program on paper first and then start testing on the computer. Your computer will spot errors much more quickly than you will see them yourself and may give you a clue as to what is wrong Remember that debugging programs is a long, tedious process even for expert programmers, so don't expect to get yours right first time.

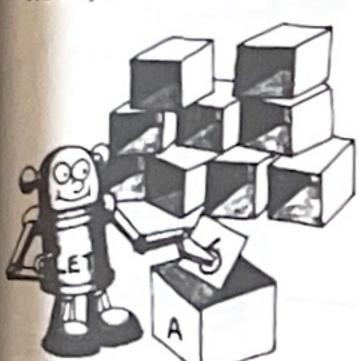

Once you have got the core of the program working, you can add to it. Scoring, extra comments, more targets etc. can all be incorporated later. You could add sections from the programs in this book to your games.

Don't expect to be able to write exciting and original games straight away. Keep your ideas very simple and be prepared to adapt them as you go along. You may find you have included something in your game which is easy for humans to do but very difficult for a computer. As you get more experienced you will begin to know instinctively what your computer can do and find it easier to write programs for it.

Summary of BASIC

This section lists some common BASIC words and describes what they make the computer do and how they are used. Most of them have been used in the programs in this book, so you can check back through the book to see how they work in a game. Not all the words can be used on all the computers mentioned in this book. The conversion chart on page 46 shows what you can use instead.

LET tells the computer to label a section of its memory and put a particular value in it e.g. LET A = 6 means label a section of memory "A" and put the value 6 in it. "A" is called a "variable" and putting something in it is called "assigning a value to a variable".

Some variable labels are followed by a dollar sign e.g. A\$. This means they are for "strings", which can contain any number of characters, including letters, numbers and symbols.

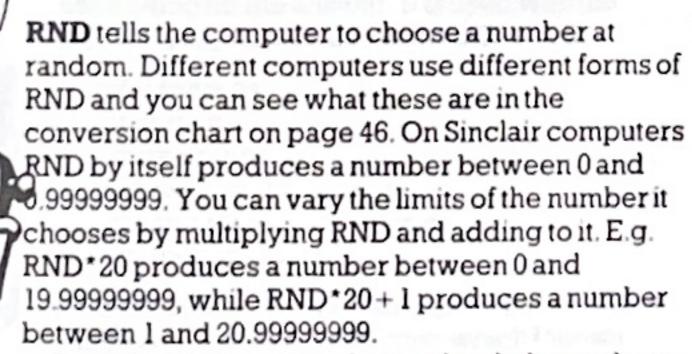

PRINT tells the computer to display things on the screen and you can use it in several ways:

A message enclosed in quotation marks with PRINT in front of it will be displayed on the screen exactly as you typed it. The section inside quotes does not have to be in BASIC, it can be anything you like.

PRINT followed by a variable label e.g. PRINT A or PRINT A\$ tells the computer to display the contents of that variable on the screen.

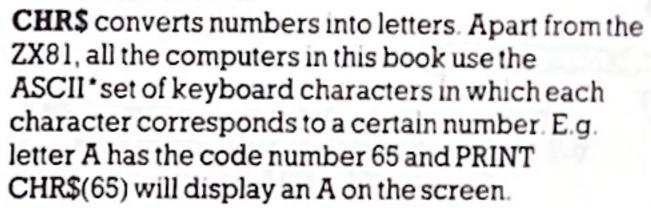

PRINT can also do calculations and then display the results e.g. PRINT 6*4 will make the computer display 24.

You can use PRINT by itself to leave an empty line.

See INT for how to produce only whole numbers. See CHR\$ for how to produce letters and other keyboard characters at random. INT is short for integer, which means whole number. For positive numbers, it tells the computer to ignore everything to the right of the decimal point. E.g. INT(20.999) is 20. For negative numbers, it ignores everything to the right of the decimal point and "increases" the number to the left of it by one e.g. INT(-3.6) is -4.

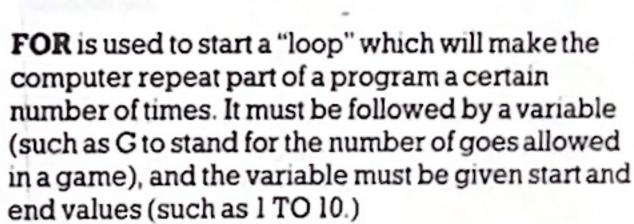

INT is often used with RND, like this: INT(RND*20+1) which tells the computer you want it to choose a whole number between 1 and 20.

You can use CHR\$ with INT and RND to make the computer select random letters, like this:

CHR\$(INT(RND*26+65))
his line will produce random le

This line will produce random letters on a ZX Spectrum (see conversion chart for other computers).

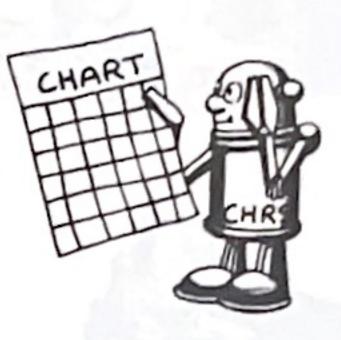

The end of the loop is marked by a NEXT line (NEXT G in this example) which increases the value of the variable by 1 each time and then sends the computer back to the FOR line again. When the variable reaches its end value, the computer ignores the NEXT line and carries on to the line which follows it. Every FOR must have a NEXT or you will get a bug.

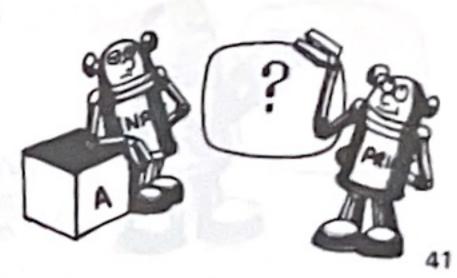

INPUT labels a space in the computer's memory, prints a question mark and then waits for you to type something which it can put in this memory space. It will not carry on with the rest of the program until you press RETURN, ENTER or NEWLINE.

You can use number or string variables with INPUT, but if you use a number variable the computer will not accept letters from you.

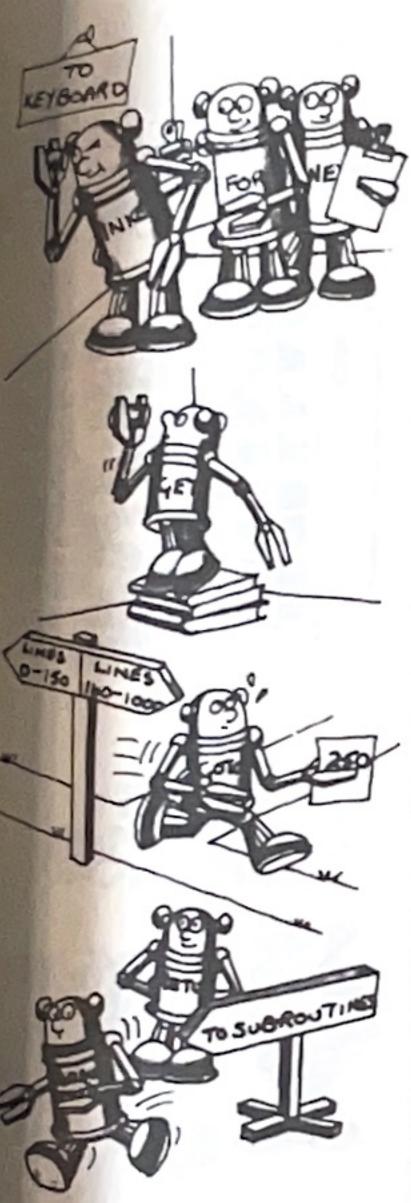

*American Standard Code for Information Interchange (see page 45)

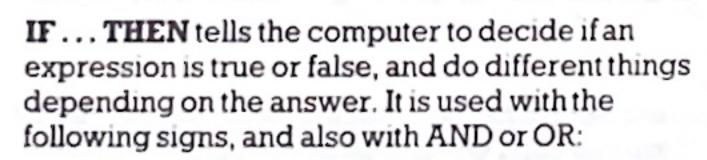

INKEYS checks the keyboard to see if a key is being pressed and if so which one. It does not wait for you to press a key like INPUT does. It is usually used in a loop which makes the computer go round checking the keyboard lots of times. This is because computers work so quickly, you wouldn't have a chance of pressing a key in the time it takes the computer to do one check.

If you haven't pressed a key before the loop finishes, the computer carries on with a string containing nothing (called a "null" string). NB Apple and VIC do not use INKEY\$.

GET is used instead of INKEY\$ on VIC and Pet computers.

GOTO makes the computer jump up or down the program ignoring the lines in between. You must put the number of the line you want it to jump to after the GOTO instruction.

GOSUB tells the computer to leave the main program and go to a sub-routine. GOSUB must be followed by the number of the first line of the subroutine. At the end of the sub-routine you must have a RETURN line. This sends the computer back to the main program to the line immediately following the GOSUB line. A GOSUB without a RETURN in a program will give a bug.

- = the same as
- < less than
- >greater than
- < = less than or the same as
- >= greater than or the same as
- <>not the same as

If the computer decides an expression is true, it carries on to do the instruction which follows THEN. If it decides it is false, it ignores the rest of that line and goes on to the next one.

CLS is used to clear everything off the screen without removing or changing anything in the memory. It is useful for removing the listing from the screen at the beginning of a RUN or in games when you want the player to react to something seen for a limited amount of time. (NB Apple and VIC do not use CLS - see conversion chart).

HOME is used by Apple computers instead of CLS to clear the screen.

ABS ignores plus and minus signs in front of numbers and takes their "absolute" values. E.g. ABS(-10) is 10 and ABS(+10) is also 10.

VAL takes the numeric value of numbers written as strings. In effect, it tells the computer to ignore the dollar sign and treat the string as an ordinary number variable. E.g. if I\$="60" then VAL(I\$) is the number 60.

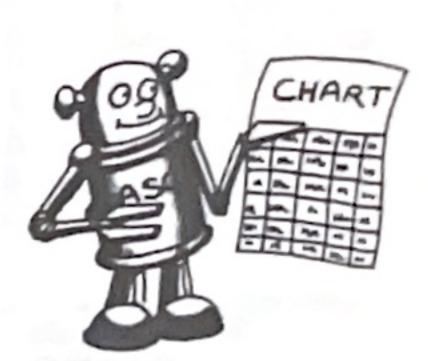

ASC converts a character into its ASCII code number e.g. ASC("3") gives 51. The expression in brackets must be a string e.g. ASC(A\$) or ASC("20").

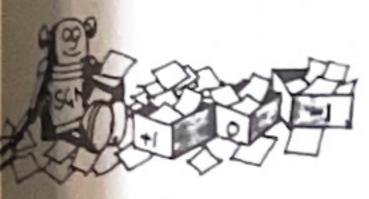

NB ZX81 and ZX Spectrum do not use ASC, though the Spectrum does use the ASCII code.

CODE is used by ZX81 and Spectrum in place of ASC. Like ASC it must always be followed by a string. Remember that the ZX81 uses different code numbers from the other computers.

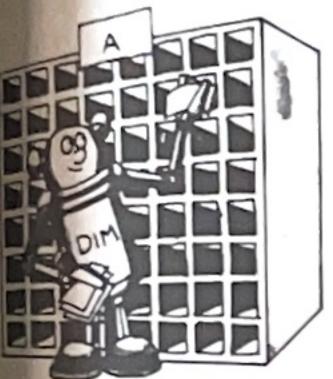

TAB moves the cursor across the screen to a specified column number. It is usually used with PRINT to display something in the middle of the screen. The number of spaces you want the cursor moved is put in brackets after TAB. The maximum number you can use depends on the screen width of your computer.

SGN tells the computer to find out the sign of a number. It produces -1 for a negative number, 0 for zero and -1 for positive numbers. E.g. SGN(-30) is -1, SGN(7) is -1 and SGN(0) is 0.

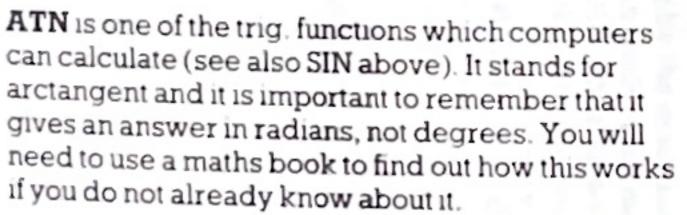

DIM tells the computer how much memory space will be needed for an "array" (a row or a grid). E.g. DIM X(6) tells the computer to set aside an area large enough to contain a row of 6 elements and labelled X. DIM A(8,8) means a memory space labelled A and big enough to take 8 elements across and 8 down is needed. The number of elements of data used in the program must correspond to the numbers in brackets after DIM or you will get a bug.

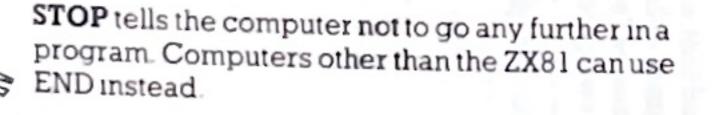

SQR takes square roots of numbers. E.g. SQR(16) gives the answer 4.

sin calculates the sine of an angle. In a right-angled triangle the length of the side opposite an angle, divided by the length of the hypotenuse (the side opposite the right angle) is the sine of that angle. When you use SIN in a program, the angle you are using it with must be measured in radians, not degrees.

PEEK is a way of finding out what is in a specific area of the computer's memory. You need to use it with a number which specifies an "address" in the memory.

NB not used on BBC.

POKE is a special way of putting information in the computer's memory by using a memory "address". NB not used on BBC.

Answers

You may find that your answers to some of the puzzles are different to the ones given here. As long as they work on your computer then this doesn't really matter, but check to see if they are as neat and simple as the answers in the book.

Page 5 **Robot Missile**

This quick reference

book. It does

nously from machine to machine. KE, they do not use the same syst

Line 90 tells the computer how many times to loop round and get a guess from you. So, for more chances of guessing the secret code letter, change the last number in line 90 to a higher one. For less chances, change it to a lower one.

Page 7 The Vital Message

In this program, lines 150 and 160 are a "delay" loop. They make the computer do nothing for a certain length of time before going on to the next instruction in the program which is to clear the message off the screen. To make the s ZX57 LET PS=CHRS (P+51) message stay on the screen longer, you need to make the computer loop round more times. You can do this by changing the last number in line 150 to a higher one.

Page 9 Shootout

To make it possible for the computer to miss too, add the following lines in addition to those in the 'Making the game harder" box.

155 IF RND<.1 THEN GOTO 250 250 PRINT "HE SHOOTS BUT MISSES" 260 GOTO 90

Line 155 may need RND(1) or RND(0), depending on your computer.

Page 11 **Desert Tank Battle**

Add the following lines to the program to add the possibility of the robots seeing you:

175 IF RND<.05 THEN GOTD 250 250 PRINT "THEY'VE SEEN YOU-AAGGGHHHH" 260 STOP

Change the RND in line 175 to the version your computer needs. You can change .05 to any number between 0 and 0.999, but remember that the higher the number you put here the greater the chance of the robots seeing you.

Page 13 **Battle at Traitor's Castle**

This is a difficult puzzle, so don't worry if you couldn't do it. Try out the answer anyway. Add these lines to get the two targets.

★日本057 LET P\$=CHR\$ (P+78) 70 IF L=T THEN LET R\$=R\$+P\$ 180 LET S=5+P

Page 15 Robot Invaders

You can get 100 points for U, V, W, X or Y and 10 points for the others by making these changes.

220 LET H=H+10 225 IF P\$>"T" AND P\$<"Z" THEN LET H=H+90

Page 17 Secret Weapon

You can add the scoring system in the

puzzle by putting these extra lines into the program.

15 LET S=0 145 IF Z<=3 THEN LET S=S+1 190 GOTO 217 215 LET S=S+10 217 PRINT "YOU SCORED ";S;" POINTS"

Page 19 Escape!

This is the simplest way to add three robots to the game, though it makes the game rather difficult to win.

22 FOR R=1 TO 3 25 PRINT "ROBOT ";R 300 NEXT R 310 STOP

Page 21 Pirate Dogfight

To make your chance of hitting the pirate equal to his chance of hitting you, change the .7 in line 290 to .5.

Page 23 Supersonic Bomber

To get more targets each time, change the 5 in lines 30, 70 and 120 to a higher number. You must put the same number in all three lines.

Page 25 Iceberg

You can make the grid bigger by changing all the 8s in lines 20, 50, 70, 80, 110, 120, 160, 170, 290 and 310 to a bigger number. (Use the same number each time.)

To add more icebergs change the 4 in line 30 to a higher number.

Going further

Here is a list of books you should find useful if you want to find out more about computers or writing programs.

Usborne Guide to Computers by Brian Reffin Smith, Usborne Understanding the Micro by Judy Tatchell and Bill Bennett, Usborne Usborne

Introduction to Computer
Programming by Brian Reffin
