

-10

Inadequate for experimental testing of the theory. It is the intermediate level of question that Bertin's question taxonomy suffers from the greatest lack of detail. A more detailed, unambiguous taxonomy is needed for adequate experimental control of questions. In commenting on the work of Warner, et al. Davis, et al. (1975) analyze this problem in greater detail. In commenting on the work of Warner, et al. (1972), Bertin asserts that ~~that~~ it is only with relatively complex information sets that the advantages of graphic forms of presentation are apparent. To insure that the results of these studies are not biased against graphic information presentation, it is important that ~~a~~ relatively complex information sets are used (Warner, et al., 1975).

Revision of Framework.
